

Strategic Network Assessment

Stable LAN, Internet and WAN Connectivity are Mission Critical!

For many organizations, the loss of internet or WAN connectivity often causes a major business impact and can bring operations to a screeching halt. We all are relying on Internet or WAN connectivity more for mission critical applications such as email, web access, chat, video training, cloud applications and often VOIP.

Understand What is on Your Network

The Network Assessment is specifically designed to provide expert documentation and analysis of the physical and logical aspects of the network topology and equipment configurations.

The Network Assessment focuses on the customized needs of the client organization while employing a proven process driven assessment approach. An executive summary and graphic illustration of the findings from multiple perspectives are provided.

The Network Assessment report provided after the diagnostics and discovery has been conducted, is an easy to understand and comprehensive technical explanation of the subject network and is a useful tool for just about any future IT projects. In addition, the report will include recommendations for remediation such as how to modify system configurations, and other necessary changes to best ensure a fast and reliable experience for the users within your organization.

Deliverables of the Network Assessment can include:

- Discover and map all relevant physical network devices
- Document logical topology including IP addressing, subnets and VLANs
- Identify network configuration issues
- Conduct inventory of software, services, and OS with End of Life/End of Support analysis
- Unpatched or out-of-date anomalies on devices
- Measure overall exposure and risk to downtime due to network failure
- Analyze redundancy and resiliency consistent with business objectives
- Ensure compliance with internal policies

Strategic WI-FI Assessment

Network & Wireless Assessment: Stop The Plug And Pray Insanity!

Do you struggle with any of these issues in your wireless network?

- Weak WI-FI signal and bottlenecks
- Spotty coverage in certain areas of your building or campus
- Legacy wireless infrastructure that can't keep up with today's heavy mobile usage

Your customers and employees expect strong WI-FI that is available throughout your building or campus environment. Employees rely on WI-FI when they are away from their office in conference rooms, cafeterias, lounges, and other areas of the building. Visitors expect to have access to the internet at least as fast and as readily as they have it at home.

What we do...

Five Star helps customers, ranging from startups to large enterprises build and manage a winning network and WI-FI strategy. Our experienced team helps you to build and manage a cutting-edge infrastructure for your current and future needs. Our expertise in multiple verticals enables us to craft winning solutions with lower latency, higher uptime while being adaptable to changing service needs.

We review with you your current concerns about your wireless network infrastructure.

We assess your existing wireless network to uncover technical deficiencies.

We design a new or supplemental wireless infrastructure to provide you with enterprise quality WI-FI throughout your building or campus.

Gain a valuable competitive edge using the latest WI-FI technology with Five Star wireless infrastructure solutions and services!
